What is an uninterruptible power supply (UPS battery backup)?

An Uninterruptible Power Supply (aka a UPS Battery Backup) protects vital connected equipment -- computers, servers, and telecommunications equipment -- from power outages. During an outage, that small UPS Battery Backup under your desk at work gives you enough time to save your spreadsheet and properly shut down your computer.

What are the benefits of an UPS system?

Key benefits of a UPS system: Provides short-term power to a critical load(e.g. server room) during a power outage,allowing time for an alternative supply,such as a standby generator to be brought on-line. Protects equipment by filtering a range of electrical disturbances,thus providing a clean power supply.

What is the main function of an ups?

The primary role of any UPS is to provide short-term power when the input power source fails. However,most UPS units are also capable in varying degrees of correcting common utility power problems:

Do ups save energy?

New UPS technology,such as that listed on the ETL,can deliver an estimated 4%energy savings relative to the market average. UPS units not only improve the quality of the electrical supply,but also smooth out any surges,spikes or dips in the power supply which could damage equipment.

Why do you need an ups?

A UPS provides battery backup power and protection for electronic devices,including: Business: Downtime caused by power outages is frustrating for anyone,but can be financially crippling for a business or organization. Every year,billions of dollars are lost due to downtime caused by power disruptions that could have been prevented by a UPS.

How much power does an ups need?

When sizing a UPS for your specific requirements,the power factor matters most. Generally,your UPS should have an Output Watt Capacity 20-25% higher than the total power drawn by any attached equipment. How much runtime do you need to support your attached equipment? That depends on what you intend to backup with your UPS.
