# **SOLAR** PRO. Vacuum energy storage welding

#### How does a vacuum weld work?

In a vacuum weld, a system of sliding seals and precision handling enables fast longitudinal and circumferential welds on large workpieces. A coarse vacuum is ideal for this process, resulting in the fastest thick section welding rates ever. There is no filler wire involved, making the weld autogenous.

#### What are the advantages of vacuum welding?

The vacuum promotes degasification. This reduces probability of pore formation to a non-detectable level. In addition, the risk of hot cracks is minimized as well. The possible penetration depth can be nearly doubled with the same beam power. With this deep penetration, the weld seams can be as narrow as in electron beam welding.

#### What is a vacuum system for laser welding?

The coupling-in windowfor coupling the laser beam into a vacuum is the key part of vacuum system for laser welding. The ambient pressure has a significant influence on the phenomena of laser welding. The changes of plasma plume,keyhole and molten pool behaviors result in an excellent sound and deep welding performance.

#### How to perform laser welding under vacuum?

In order to carry out laser welding under vacuum, the first issue is to build up a vacuum chamberfor laser welding. The simplest way is to refer to the basic design of electron beam welding. Instead of an electron beam generator, a laser processing head is installed in vacuum chamber.

What is the vacuum chamber structure of laser welding?

Compared with electron beam welding, laser welding under vacuum has a relatively low requirement of vacuum level. Therefore, the vacuum chamber structure of laser welding is relatively simple. Hence, the key part of the vacuum chamber is the coupling-in window for coupling the laser beam into the vacuum.

Is electron beam welding a vacuum welding machine?

Electron beam welding processes are usually carried out in a vacuum, yet there are also non-vacuum welding machines available.

2 storage tanks constructed in mid-1960s at NASA Kennedy Space Center in Florida by Chicago Bridge & Iron - These vacuum-perlite insulated tanks, still in service, are 3,200 m3 capacity ...

This is why austenitic steel and titanium are used commonly in vacuum-sealed tanks, pressure vessels, and refrigeration units to store and ship liquified gases. ... we discuss ...

Compared with electron beam welding, laser welding under vacuum has a relatively low requirement of vacuum level. Therefore, the vacuum chamber structure of laser welding is relatively simple. Hence, the key
