## **SOLAR** PRO. Virtual heat energy storage device

## What is a heat network virtual energy storage system?

During a scheduling period, if the heat source heat output is greater than (less than) the user's heat demand, the heat network virtual energy storage system plays an energy storage (or discharge) role, which is reflected by the return water temperature increases (or decreases) compared to the previous period.

Does virtual energy storage reduce the cost of electric-heat integrated energy system?

The results show that the operation optimization method considering the virtual energy storage of heat supply network will greatly enhance the complementary potential of the electric-heat integrated energy system and reduce the operation cost of the system.

What is the operation optimization model for electric-heat integrated energy system?

In this paper, based on the latency and virtual energy storage characteristics of the heating network, an operation optimization model for the electric-heat integrated energy system is established, which takes into account the dynamic characteristics of heat energy transmission:

What are the characteristics of a heating system?

The heating system includes cogeneration, electric boiler, heat exchange station, and heat network to meet the needs of users. The transmission of electric energy in the power system has the characteristics of real-time, fast and strong balance, and the storage of electric energy has the disadvantage of high cost and difficult storage.

What should the heat output of the energy equipment be?

The heat output of the energy equipment in Scenario 1 should be equal to the heating demandat all times, regardless of the latency and virtual energy storage characteristics of the heat network, and only the losses of the heat network should be considered.

What is the power system in electric-heat IES?

In the electric-heat IES, the power system mainly includes cogeneration units, photovoltaic panels, wind turbines, distribution grids, etc, who are responsible for the supply and transmission of electricity in the entire system.
