What is integrated water storage planning?

The proposed integrated water storage planning framework is grounded in sustainable development and climate resilience, with the potential to pay dividends for people, economies, and environments for generations. Key Messages:

What is storage in water management?

Storage is part of a larger system of water resource management tools for managing resilience. Storage systems are one tool that water managers have for providing numerous services to societies (present and future) as well as for managing the resource (e.g. in relation to floods,droughts,and water quality) to protect communities.

Is water storage a key to resilient development?

This paper outlines a new and integrated water storage agenda for resilient development in a world increasingly characterised by water stress and climate uncertainty and variability. Storing water has long been a cornerstone of socio-economic development, particularly for societies exposed to large climatic variability.

Why should local communities be involved in water storage planning & management?

Recognizing this, engaging local communities in water storage planning and management fosters ownership and empowers them to contribute to decision-making processes. By involving community members, their traditional knowledge, experiences, and aspirations can be integrated into the planning and management of water storage projects.

How can we address future challenges in water storage and management?

As we face the effects of climate change, population growth, and urbanization, we must anticipate and address future challenges in water storage and management. This includes developing adaptive strategies, investing in research and development, and fostering international collaborations to find innovative solutions.

Why do we need water storage projects?

It is essential to engage with these communities and address their concerns, ensuring that their rights are respected and that they are adequately compensated for their displacement. Additionally, water storage projects can provide opportunities for economic development, such as job creation and increased agricultural productivity.
