# What is deep tech s energy storage business

#### What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Will deep tech be part of your company's Future?

This is the first in a series of articles highlighting how deep tech--the problem-driven application of advanced technologies to address large-scale issues--can help deliver superior value and growth while enabling companies to achieve their goals. Here we examine why deep tech will almost certainlybe part of your company's future.

Does energy storage allow for deep decarbonization of electricity production?

Our study extends the existing literature by evaluating the role of energy storage in allowing for deep decarbonization of electricity production through the use of weather-dependent renewable resources (i.e., wind and solar).

Why is deep tech making deep inroads?

There are plenty of reasons why deep tech is starting to make deep inroads. One of the biggest and most immediate is the global push for more-sustainable business practices. We know that in many industries,true sustainability (net-zero emissions,for example) cannot be achieved without the help of new technologies.

What are the different types of energy storage technologies?

We examine nine currently available energy storage technologies: pumped-hydroelectric storage (PHS), adiabatic (ACAES), and diabatic (DCAES) compressed air energy storage (CAES), and lead-acid (PbA), vanadium-redox (VRB), lithium-ion (Li-ion), sodium-sulfur (NaS), polysulfide bromide (PSB), and zinc-bromine (ZNBR) batteries.

#### Why is deep tech so difficult?

But deep tech presents established companies with a twofold challenge. Evaluating the potential of advanced technologies is tough, and finding a winning combination of market need and emerging technology that meets it is harder still. Even the most successful venture capitalists place more losing bets than winning ones.
